

RES PowerFuse Series 8

User workspace management for Microsoft Windows®

RES PowerFuse Series 8 is the next generation of user workspace management, offering:

- Redesigned enterprise architecture for increased speed, reliability and scalability.
- New innovative technologies for increased flexibility, integral workspace security and seamless integration with RES Wisdom IT Task Automation.
- Improved manageability and reduced complexity.

Increased speed, reliability and scalability

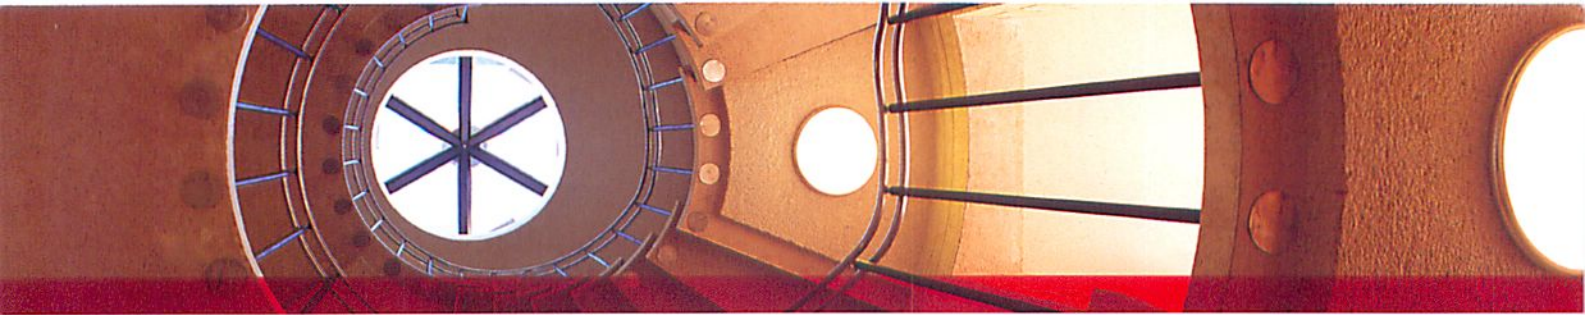

RES PowerFuse Series 8 is enterprise-ready, with offline configuration data cache for increased workspace speed. This offline data cache is kept in sync with your central database, ensuring reliability of configuration data. Your users will work more efficiently with lower response times.

Its enterprise architecture enables you to add new databases and replicate your configuration data using any replication topology. This means there are no limitations to the size and scope possible, making it a truly scalable solution for your enterprise.

The new flexible architecture removes traditional limitations, while creating endless possibilities for controlled expansion. Now you can perform simple administration and secure management of all your user workspaces, as well as effortless control of your software license portfolio, making it more reliable for your business.

RES PowerFuse Series 8 delivers a personalized but unified desktop by giving administrators total management control of every exposed IT service in their Windows environment. It provides access to the right applications at the right place at the right time, ensuring user productivity. It also reduces complexity and masks technical changes from the business.

As part of Solution Assurance, all customers with a valid subscription are eligible to upgrade their current version of RES PowerFuse.

New technologies, unlimited potential

You will be familiar with many of the features of RES PowerFuse Series 8 from earlier releases. But there is a range of newly-introduced technologies that save you even more valuable time, cost and effort.

RES Wisdom integration

An important new aspect of RES PowerFuse Series 8 is seamless integration with RES Wisdom. This means you can now automatically schedule and trigger IT tasks, ranging from application installation to configuring computers. This powerful flexibility means you can leverage the strength of RES Wisdom and RES PowerFuse Series 8, further increasing ease of use.

Consistent user preferences

RES PowerFuse Series 8 allows you to make user preferences consistent across multiple platforms by decoupling the actual preferences from the underlying (roaming) user profile. Instead of maintaining long profile lists per user, you can easily limit the number of user-definable elements, slimming down the list and creating a more user-centric experience across different platforms.

Integral workspace security

Security is a concern for every company, whether your network spans 2 offices or 20 countries. RES PowerFuse Series 8 continues to protect your workspaces in a number of ways, using an intuitive, granular interface, which also offers a learning mode for increased ease of use:

- **New IP connections security:** decreasing visibility to the outside world while increasing end-to-end security from the user right to the back end. You can now set business rules and permissions, restricting access per user session down to a range of IP addresses, even down to a specific port.
- **Improved application security:** using nested PowerZones and location sensing, authorized users will have access to the right applications depending where they are, what they need, and when they need it.

- **Granular removable disk security:** an additional level of workspace security uses unique USB serial numbers to provide multifactored authentication for application access.

Improved manageability, reduced complexity

RES PowerFuse Series 8 provides enterprise-readiness by giving you full control and scalability in user workspace management. Filters can be applied to reduce the amount of information presented to IT, while delegation (scope control for security roles) offers simple and accurate management of each type of user workspace, resulting in a significant reduction in complexity.

To summarize:

- Enterprise architecture increases speed, reliability and scalability.
- New innovative technology enables RES Wisdom integration, consistent user preferences and increased integral security.
- Manageability is improved and complexity is reduced through use of workspaces, filters and scopes.
- As part of Solution Assurance, all customers with a valid subscription are eligible to upgrade their current version of RES PowerFuse.
